Sub Category

Subject Archive capacity requirements

Description of Problem or Suggestion:

SDR baseline shows "6 months spare capacity to support reprocessing." But there is a requirement to keep data at least 6 months after it has become eligible for deletion (having been reprocessed). During this 6 months, one year's data will be reprocessed (consistent with the 2x reprocessing CPU capacity).

Originator's Recommendation

Phase up to at least one year "spare" capacity to support reprocessing.

We concur. The archive will be sized to provide archive capacity for one year of spare capacity for reprocessed data. The first six-months of capacity will be phased in one year after launch with the second six-months of capacity phased in two years after launch to be consistent with reprocessing capacity. This strategy was presented at Release B RIR.
